

Add another Implementation for Intervention_assessment.

@literexia\lib\features\assessments\ui\

Alphabet, Phonological, Word recognition, Decoding, Reading Compre screen can handle pre_assessment and main assessment. Now add the intervention_assessment also. Dont reuse or change any existing code. So there are three of them.

Now, there's a validation that if the user has not taken the existing category in home screen the color is yellow and if the user passed it, the color of the circle in the home screen will be green. And is the user failed the existing category in home screen the circle and header will turn to red and there's a message that user needs to take the intervention "INTERVENTION NEEDED!". And user cannot take the other category if did not passed or take the current category. Like in the image its locked.

And the code scan the user account if there's a taken and failed category it will scan it in collection: failed_category_result. Using this format.

example:

```
{
  "_id": {
    "$oid": "68d19fbc18b453fb0a038f33"
  },
  "studentId": 202549506,
  "categoryName": "Alphabet Knowledge",
  "score": 0,
  "totalQuestions": 15,
  "correctAnswers": 0,
  "attemptDate": "2025-09-23T03:13:00.475272",
  "assessmentId": "683a51d3168ffbb611dab96e",
  "readingLevel": "Low Emerging",
  "isPassed": false,
  "passingThreshold": 75
}
```

So if user logout and login again it should show the red circle.

If user click that red circle it will directed to intervention_assessment collection
@literexia\lib\features\assessments\ui\
(Alphabet, Phonological, Word recognition, Decoding, Reading Compre screen). And
also the provided intervention_assessment is based on their reading level.
